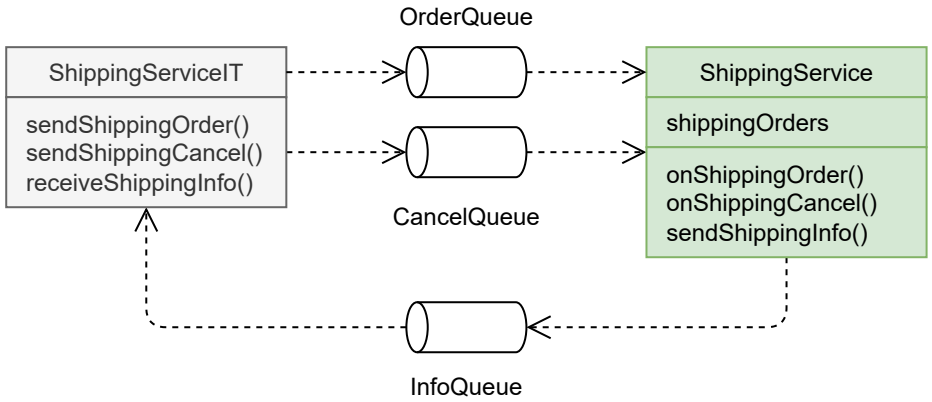
Spring Project

Project: Shipping Service



1. Implement a Spring Boot application with a shipping service that maintains shipping orders and
   - receives `ShippingOrder` messages from the `OrderQueue` and processes them by waiting a fixed time interval using a task scheduler
   - receives `ShippingCancel` messages from the `CancelQueue` and cancels the shipping if the order has not yet been shipped
   - sends `ShippingInfo` messages to the `InfoQueue` whenever the status of an order has changed
2. Implement an integration test to verify the functionality of the service.

Shipping Message API (../../message-api/index.html)
