

Spring Project

Project: Catalog REST Service

1. Implement a REST controller `CatalogController` that supports the following REST requests:
 - `POST /books` – Add a book to the catalog
 - `GET /books/{isbn}` – Find a book by its ISBN number
 - `GET /books?keyword={keyword}` – Search for books by keyword
 - `PUT /books/{isbn}` – Update a book
2. Use the `server.port` application property to start the catalog microservice on port 8001.
3. Test the controller using the Postman (<https://www.getpostman.com/>) utility.
