

Spring Web

Exercise: Todo REST Client

1. Clone the GitLab repository Todo (<https://gitlab.ti.bfh.ch/cas-sad-hs25/spring-web/todo>) and copy the application.
2. Remove the persistence artifacts (dependencies, repository, entity annotations) and add the `spring-boot-starter-webmvc` Maven dependency.
3. Rename the `TodoService` class to `TodoProxy`.
4. Use the Spring RestClient (<https://docs.spring.io/spring-framework/docs/current/javadoc>)

api.org/springframework/web/client/RestClient.html) to implement the proxy methods which send REST requests to the web service.

5. In the `findTodo` and `updateTodo` methods catch the `HttpClientErrorException.NotFound` exception, get the problem detail using the `getResponseBodyAs` method and rethrow a `TodoNotFoundException`.
6. Start the client application without web server:

```
new SpringApplicationBuilder(Application.class).web(NONE).run(args);
```

Solution (<https://gitlab.ti.bfh.ch/cas-sad-hs25/spring-web/todo/-/commits>)
