

Spring Core

Exercise: Hello Application (Components)

1. Command Line Runner

- Implement a Spring Boot application with a command line runner `TestRunner` as component
- In the `run` method, print a hello message to the console

2. Service Components

- Implement a service `HelloService` with a method `sayHello(String name, int age)` that returns a casual or formal message depending on the age of the user
- Implement a service `GreetingService` with a `getGreeting()` method that returns a greeting depending on the daytime

3. Dependency Injection

- Inject the Greeting service into the Hello service and use it to create the formal hello message
- Inject the Hello service into the command line runner and invoke its method

4. Lifecycle Callbacks

- Implement the lifecycle callbacks `PostConstruct` and `PreDestroy` to observe the construction and destruction of the service instances
